

HTML5: embedding CSS styles with the scoped attribute of the style element

Embedding CSS styles into the HTML elements of a web document is allowed by the HTML5 specifications, provided that you use the `scoped` attribute of the `style` element. This feature has interesting implementations for some popular CMS frameworks (such as WordPress) where many widgets and plugins make a large use of this kind of embedded styles.

Just a word of caution: if you're developing a widget or a plugin, you can't know in advance which kind of DTD will be used. This feature is valid in HTML5 only, so be cautious.
