

JavaScript: enable and disable stylesheets

There is a quick and simple solution to enable or disable stylesheets with JavaScript.

We only need to toggle the boolean property `disabled` associated with every `styleSheet` object.

```
'use strict';

const disableStyles = () => {
  for(let i = 0; i < document.styleSheets.length;
i++) {
    document.styleSheets[i].disabled = true;
  }
};

const enableStyles = () => {
  for(let i = 0; i < document.styleSheets.length;
i++) {
    document.styleSheets[i].disabled = false;
  }
};

document.addEventListener('DOMContentLoaded', () => {

document.querySelector('#disable').addEventListener(
'click', disableStyles);
```

```
document.querySelector('#enable').addEventListener(  
  'click', enableStyles);  
});
```

You can see the above code in action on the following page.
